The MAILING DATE of this communication app Period for Reply	ears on the cover sheet with the c	orrespondence ad	ldress				
A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION. - Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication. - If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication. - Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

DETAILED ACTION

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Claims 1-2, 7-9, 12, 14-15 and 18-23 are rejected under 35 U.S.C. 103(a) as being unpatentable over Clarey '713 in view of Dye.

Clarey discloses in figures 1-3 a splint for immobilizing and supporting a body part of a human by covering the body part from three sides, the splint comprising inflatable tubes 24, interconnected by non-inflatable parts 22, for achieving variable degrees of support, stiffness and restriction of movement, the tubes and the non-inflatable parts are made of a flexible material (col. 2, lines 65-68), having two opposing edges (non inflatable part 22, fig. 3, has a first edge connected to 24 on the left side of 22 and a second edge connected to the opposite 24 on the right side of 22), (inflatable tubes 24 have a first edge connected at 18 and a second edge connected before 22, in fig. 3), the splint is constructed to be wrapped around a body part in a circumferential direction (fig. 2), each of the non-inflatable parts is located to extend between two of the inflatable tubes (fig. 1), the inflatable tubes and the non-inflatable parts extend in a direction transverse to the circumferential direction (fig. 1), at least one pressure source (the tubes can be inflated oral), at least one adjustable member (velcro, col. 3, lines 25-30, for connecting the splint edges together, the splint takes up the shape of the body

Art Unit: 3772

part (fig. 2), the tightness of the splint on the body part can be controlled by fastening or loosening of the adjustable member, the pressure is controlled by a valve (col. 3, lines 30-35), the adjustable member is detachable (velcro is detachable, removing the hook from the loop fasteners). However, Clarey doesn't disclose ventilation holes in the non-inflatable parts or the splint being made of two layers of nylon which are jointed by soldering means and coated with polyurethane. Dye teaches in figures 1-7 a splint comprising ventilation holes 44, two layers of nylon (polyester) joined by a soldering means (heat sealing) and a polyurethane coating (a polymer). It would have been obvious to one having ordinary skill in the art at the time that the invention was made that the ventilation holes as taught by Dye could be incorporated into the non-inflatable parts disclosed by Clarey in order to use the holes to ventilate the skin to prevent overheating of the skin while wearing the splint. The nylon material would allow the splint to expand to fit different user. The polyurethane would protect the nylon and make the splint more durable. It is old and well know that polyurethane is a polymer.

Claim 10 is rejected under 35 U.S.C. 103(a) as being unpatentable over the references as applied to claims above, and further in view of Porrata.

Porrata teaches in figure 1 a splint comprising a pressure source that is a hand pump 26. It would have been obvious to one having ordinary skill in the art at the time that the invention was made that the hand pump as taught by Porrata could be substituted for the oral inflation disclosed by Clarey because both inflatable sources are interchangeable.

Application/Control Number: 10/797,278 Page 4

Art Unit: 3772

Claims 13 and 16-17 are rejected under 35 U.S.C. 103(a) as being unpatentable over the references as applied to claims above, and further in view of Simons.

Simons teaches in figure 3 loops (66, 67) that act as a suspension strap. It would have been obvious to one having ordinary skill in the art at the time that the invention was made that the loops as taught by Simons could be incorporated into the splint disclosed by Clarey and Dye in order to use the loops to suspend the device. The loops are connected to the outer edge of the device. Consequently they can be connected to the edge of the splint.

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to MICHAEL BROWN whose telephone number is (571)272-4972. The examiner can normally be reached on 5:30 am-4:00 pm Monday-Thursday.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Patricia Bianco can be reached on 571-272-4940. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
